SUMMARY

Gameplay and systems programmer, B.S. Computer Science December 2026. Shipped Banana Clicker on Steam (1,000+ sales) and lead engineering on No Dogs Allowed, a 2D Metroidvania in Unity 6: movement, combat, level logic, and the in-editor content tools. Also built a server-authoritative multiplayer prototype on SpacetimeDB and a Rust/Macroquad open-world sim.

SKILLS

Languages: C#, C++, Rust, TypeScript, Python

Engines & Runtime: Unity (URP, UGUI, ScriptableObjects, Addressables), MonoGame, Unreal (C++), Godot, Macroquad

Gameplay Systems: Player controllers, combat, progression/economy balancing, procedural content, multiplayer (server-authoritative), shaders/post-processing

Tools & Pipeline: Git/GitHub, Steamworks SDK, SpacetimeDB, in-editor content tools, automated tests, Vercel

EXPERIENCE

Founder & Lead Developer | Siphon Games, Brooklyn, NY (remote team)

Apr 2023 – Present

- Designed, built, and shipped Banana Clicker (Unity/C#) on Steam, Mar 2023: layered idle progression, resource loops, upgrade trees, gacha events; 1,000+ unique sales; 10+ patches. ~23k lines of C# with a service-locator core, typed event bus, Addressables data, and Steamworks achievements (github.com/AbsoluteSG/banana-clicker-source).
- Lead gameplay programming on No Dogs Allowed, a 2D Metroidvania in Unity 6 (URP 2D): player controller with bipedal/quadruped stance swapping, hitbox combat with attack chaining and a full-screen parry effect, data-driven weapons/recipes/crops/quests, GOAP enemy AI, FMOD, Yarn Spinner. ~55k lines across nine assemblies.
- Built in-editor content tools for a distributed team of artists and composers; run the Git workflow, documentation, and milestone schedule.

Help Desk Assistant | CUNY College of Staten Island, Staten Island, NY

Jul 2022 – Dec 2023

- Front-line technical support for students, faculty, and staff; triaged and documented tickets in the campus ticketing system.

PROJECTS

Vrox — server-authoritative multiplayer shooter — C#, Unity, SpacetimeDB [code](#)

- Authoritative server module owns all player and projectile state; clients send intent at 20 Hz and render server truth. Projectiles are written once and positioned analytically ($\text{origin} + \text{dir} \cdot \text{speed} \cdot t$), so a bullet costs one insert and one delete regardless of flight time.

Critter Cove — co-op zoo builder — Rust, Macroquad, SpacetimeDB, Steamworks [code](#)

- ~30k lines of Rust across three crates with 200+ tests on the engine-free domain: chunk streaming with hysteresis, noise-driven biomes with weighted spawn tables, 100+ species with hybrid recipes, versioned saves with forward migrations, a Steam relay transport, and a SpacetimeDB online hub.

Vision Bots — game agents from screen capture — Python, YOLOv8, OpenCV, Gymnasium, Stable-Baselines3 [write-up](#)

- Fine-tuned two YOLOv8 detectors on 340 hand-labelled frames (AP@0.5 0.94 on the player class); built a landmark-graph navigator with belief state and recovery behaviours, and a PPO agent driving a second game through a Gymnasium env at 15 Hz. No game API: Win32 capture in, synthetic input out.

EDUCATION

B.S. Computer Science | CUNY College of Staten Island

Expected Dec 2026

Coursework: Data Structures & Algorithms, Object-Oriented Programming, Operating Systems, Database Systems, High-Performance Computing, Calculus I–III, Linear Algebra
